## Type Properties

## Loading and placing into the Project:

The Equipment Shelf is supplied and can be loaded into a Revit project through all traditional methods. There are no family supporting files (i.e. type catalog, look up tables or render library files). A face based host is required in a Revit project for proper placement or insertion. It is recommended that the family be placed in a Section View and then aligned to a compatible Ortronics Rack Mount System for optimum placement accuracy. When inserting the geometry, turn on Data Devices in the (VG) Visibility Graphics to view the geometry. There is no model geometry displayed in Plan view in all levels of detail. Masking regions are used in fine detail to improve project performance.

## Project Behavior:

This family is intended to be used with compatible components.

### Instance Parameters:

In the “Instance Parameters”, the user can control the following options:

- Equipment Number – For tagging each placed instance.

### Type Parameters:

Each type represents a manufactured product. Therefore the type parameters in the “Identity Data” should not be modified. The same contains important basic data related to the types in the family as indicated below:

- Product Documentation Link – Directs a webpage to the products online listing
- Equipment Abbreviation – For tagging each placed type

The family contains three (3) types whose values do not need to be modified by the user for standard configuration.

**19”, 17”**

**19”, 19”**

**23”, 21”**

Within the type properties dialogue the user will find useful information for scheduling purposes such as Width, Depth, Height, and other unique properties of the family. In “Identity Data” the user will find information specific to the model, i.e.: family revision information, Ortronics copyright information, model description, product URL and other specific data. \*See scheduling description below.

## Rendering:

When the family file is loaded into the project, standard Ortronics materials are imported. These may be modified, though ensure that the modification selection matches an actual manufacturer supplied option.

## Scheduling & BOM creation:

Ortronics products may be scheduled utilizing the schedule view in the given project file. Select and copy (**Ctrl-C**) the schedule from the sheet view and paste it (**Ctrl-V**) into a sheet in your project. The schedule filters are set to look for only those units designated with **Manufacturer** as “Legrand I Ortronics” and **Equipment Abbreviation** as “RMS”. The schedules contain special functionality for displaying the configured order numbers of the different selected types.
