

Low Voltage Switch Wiring

Channel & Relay Inputs: Each relay has an associated switch input for a standard low voltage control switch. These switch inputs accept either a 2- or 3-wire, maintained or momentary dry contact switch. Channel inputs are found on an optional Group Switch Module and wire the same as the relay inputs.

Isolated Pilot Contacts: Each relay has an isolated pilot contact (1 Amp, 24 VAC), which is normally used to control a pilot light with 24VACR. It may also be used to provide status feedback to another system or provide 24VDC or 24 VAC.
