Walker® electrical systems conform to and should be properly grounded in compliance with requirements of the current National Code or codes administered by local authorities.

All electrical products may present a possible shock or fire hazard if improperly installed or used. Walker electrical products may bear the mark as UL listed and/or classified and should be installed in conformance with current local and/or the National Electrical Code.

1. Locate center of duct runs using measurements from insert markers. Determine location of activation fitting, then core drill a 4" [102mm] diameter hole through the concrete to the top of the duct. **Do not drill through the raceway metal.**

2. Drill 2 1/2" [64mm] diameter hole in duct concentric with the center of the 4" [102mm] diameter hole in the concrete.

3. Install attaching ring (Cat. No. 439) using the two locking tabs to secure it to the duct. Locking tabs are to be secured to the left and right sides of the duct.

4. Attach the carpet flange to the attaching ring with four #6-32 flat head screws provided (length of screws are determined by depth of concrete over duct).

5. Pull wires through opening in bottom of attaching ring and wire devices in accordance with the National Electrical Code and any local code that applies.

6. Secure devices to carpet flange using screws provided (orient receptacles with neutral sides facing one another).

7. Place receptacle membrane over receptacles and attach receptacle plate to carpet flange with four flat head self threading screws.
