

Ortronics® reduced diameter (RDC) patch cords provide a smaller cable diameter, these reduced diameter cords occupy less space required. The size reduction makes these cords a candidate when retrofitting existing rack or cabinet installations that are at capacity, with saturated vertical or horizontal management, or when new or additional cords need to be introduced into high density scenarios. The smaller cord size can also allow more viewable space on the panels to assist with port identification and provide more space for future Moves Adds Changes (MAC).
