

Wattstopper Product Notice

Subject: Power Consumption of FSP-201 and FSP-201B

Date: April 1, 2022

During normal operating conditions, the rated power consumption for the FSP-201/201B series sensor is 15mA.

When the device is being programmed using the FSIR-100, the IR transmission increases the power consumption to 45mA.

Wattstopper is revising technical documentation for the products to indicate a normal usage value and an IR programming value, which will be listed at 45mA. It is recommended that any power supplies in fixtures with the FSP-201/201B be listed to support this value if IR programming is expected.

Note: Wattstopper has retested our Bluetooth versions (FSP-301/301B) and concluded that the devices consume less than 15mA at all times, including during Bluetooth programming.
